Abstract of DE4117422

The monitoring appmts. has a row of dampers arrange din the fluid stream and has an appmts. reacting to the pressure differentiate between the inlet and outlet side sof the filters to produce and display a signal from the quotients of both pressure differences. The dampers are placed in the fluid stream behind the filter (claimed). USE/ADVANTAGE - The appmts. is used for monitoring the soiling degree of filter esp. for hydraulic fluid filters. The appmts. gives.high accuracy and repeatability of measurements.
